

Operating Instructions for Connecting the Projector to a Computer

Use the default HD1 port of the projector

1. Select the HD1 port of the projector as the signal input port, plug an HDMI high-definition cable into it, and connect to the HDMI output port of the computer.
2. Select HD1 as the signal input source on the signal input channel selection menu of the projector.

As shown in the figure.

Setting the display method on a Windows 10 computer

1. Right-click on a blank area on the desktop and select Display settings.

View(V)
Sort by(O)
Refresh(E)
Paste(P)
Paste shortcut(S)
Next desktop background(N)
NVIDIA control panel
SVN Checkout (K)
Tortoise SVN
New(W)
Display settings (D)
Personalize(R)

2. Click the Identify button to identify the display number.

[3.] The windows system will now have identified projector display No.2.

[Translation of onscreen text in table below]

Setting	
Home page	Display
Find setting	Select and re-arrange multiple displays
System	Select one display below to change its settings. Some settings will apply to all displays.

First method of setting the display in Windows 7

1. Select the HD1 port of the projector as the signal input port, plug an HDMI high-definition cable into it, and connect to the HDMI output port of the computer.
2. Select HD1 as the signal input source on the signal input channel selection menu of the projector.
3. Right-click on a blank area of the desktop and select Graphic Attributes.

Enter graphics control panel

Enter display control panel

Digital TV HDMI

Second method of setting the display in Windows 7

- 1. Select the HD1 port of the projector as the signal input port, plug an HDMI high-definition cable into it, and connect to the HDMI output port of the computer.
- 2. Select HD1 as the signal input source on the signal input channel selection menu of the projector

Right-click in the blank space of the desktop and select Screen Resolution.

Setting the display method on an Apple computer

The Thunderbolt (popularly referred to as the Thunder) port supports the Mini DisplayPort in video output, so you can use a cable or adapter to connect to the HDMI input port.

It requires crossover coupling (Thunderbolt\Mini DisplayPort to HDMI)

Patch cord (Mini DisplayPort to HDMI)

First, connect the projector to a power source, select the corresponding input source menu, and connect the USB cable to the MAC through a crossover coupling. (There is only a USB-C port and a DisplayPort interface on Apple laptops, so the crossover coupling is needed to connect.)

High definition HDMI cable connects to the projector

Once connected, the system will be recognized automatically, and you can open the system preference settings and enter the display settings on your Mac.

System preference settings					Search		
General use	Desktop and screen protection program	Dock	Mission Control	Language and region	Security and privacy	Spotlight	Notification
Display	Energy saver	Keyboard	Mouse	Touch-pad	Printer and scanner	Sound	
iCloud	Internet account	Expansion	Network	Bluetooth	Share		
Administrator and group	Parental controls	App Store	Dictation and phonetics	Date and time	Operate the keyboard	Time Machine	Miscellaneous functions

After selecting the display option, you will see two screen setting pages. Related settings such as resolution will be automatically optimized by your Mac and manual setup will not be necessary.

[Following images mostly illegible]

	Display	Arrange			

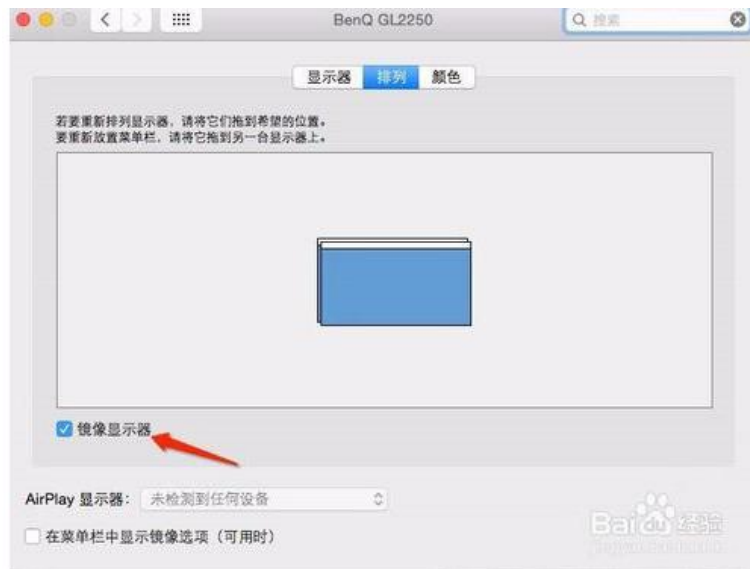

The first time you use your Mac to connect to an external projector, the external display will not show what is shown on the Mac screen. This is the unique “Ranking” display function of the Mac, which is similar to the “Extension” mode in Windows. (If you don’t like this parallel display mode, you can switch it to the traditional “direct projection” mode.)

Display	Arrange	Color
If you want to rearrange the displays, please drag them to the desired positions.		
If you want to reposition the menu bar, please drag it onto the other display.		

Mirror display
AirPlay display: no device detected.
Display the mirror display in the menu bar (when available)

Check the “mirror display” in the picture to synchronize the display on your Apple laptop with that on the projector.

If you want to reposition the menu bar, please drag it onto the other display.
Mirror display
AirPlay display: no device detected.
Display the mirroring option in the menu bar (when available)

Solutions for problems that may occur after an Apple computer is connected to the projector

After being connected, if your Mac does not recognize an HDTV, display or other HDMI device:

1. Turn off the HDMI device while your Mac is on
2. Unplug the HDMI cable from your Mac and reconnect it to your Mac.
3. Turn on the HDMI device.

If the video on the HDTV or projector extends beyond the border of the screen, you can open “Display Preference Settings” and adjust the under-scanning slider to

get a better effect. You can open “Display Preference Settings” by any of the following means:

- Select the Apple () menu > “System Preference Settings,” then click “Display.”
- Press Shift + Command + A to open the “Application Program” file folder, then double click the “System Preference Settings” and click “Display.”

Display	Color	
	Optimize	Built-in Retina Display
		The most suitable Built-in Retina Display
		scale
	Refresh rate	60 Hz (NTSC)
	Under-scanning	
	Close	More
		Collection window

If your projector is unable to receive audio from your Mac:

- Select Apple Menu > “System Preference Settings” , then click “Sound.” Make sure your projector has been selected on the “Output” panel.
- If you use a Mini DisplayPort adapter to connect, please ensure that your Mac is able to send out audio through the Mini DisplayPort.
- If you connect your projector with a Mac mini, please unplug all audio equipment connected to the audio output port of the computer.
